

Committed to Louisiana's Energy Future

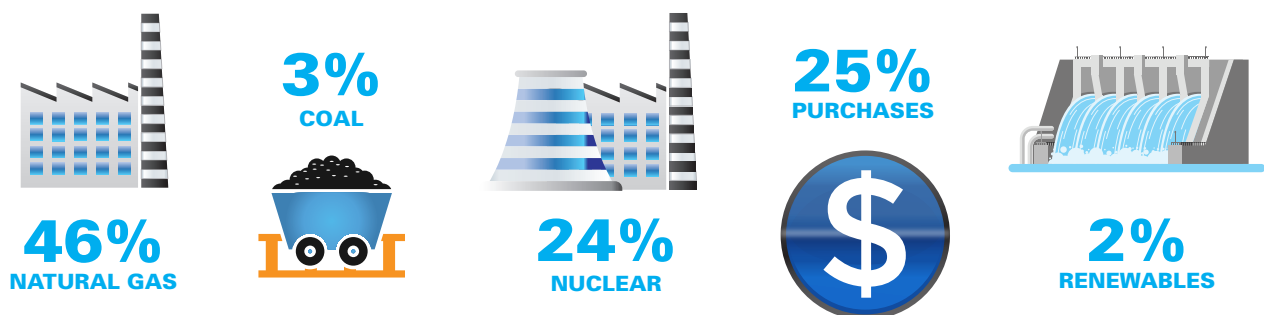

Maintaining a diverse energy portfolio is critically important for our customers. Entergy Louisiana primarily uses natural gas, nuclear energy and purchased power to meet customers' needs. This level of diversity not only keeps prices as low as possible, but it helps to control emission output.

We're also looking to the future by pursuing new sources of emission-free energy for our customers. For example, we are currently seeking regulatory approval to purchase 50 megawatts of solar power from the largest solar facility planned for Louisiana. This plant, which is expected to be built near Port Allen in West Baton Rouge Parish, will be large enough to power approximately 9,500 Louisiana homes.

These new sources will add to the approximately 180 megawatts of renewables – including hydro, waste heat recovery and biomass – currently in our generation portfolio. We are increasing our environmental efficiency with each new project. The carbon dioxide emission rate of Entergy Louisiana's generating fleet is already approximately 30 percent below the EPA standard for new combined-cycle power plants. And it will only get better as new, cleaner sources of energy are developed.
